## **OREGON'S POPULATION FORECASTS BY AGE AND SEX**

### **Procedure and Assumptions**

Population forecasts by age and sex are developed using the cohort-component projection procedure. The population by single year of age and sex is projected based on the assumption of specific assumptions of vital events and migrations. Oregon's population as of July 1, 2000 is the base population for the forecasting model. The total base population by age-sex detail is derived from the U.S. Census Bureau.

To explain the cohort-component projection procedure very briefly, the forecasting model "survives" the initial population distribution by age and sex to the next age-sex category in the following year, and then applies age-sex-specific birth and migration rates to the mid-year population. Further iterations subject the in-and-out migrants to the same vital rates.

Total populations for the years 2001 through 2007 in the following tables are annual estimates from Center for Population Research, Portland State University. The numbers of births and deaths through 2007-08 are from Oregon's Center for Health Statistics. The total populations for the period 2008 to 2015 are generated as part of the economic and revenue forecast of OEA. The numbers of births and deaths are projected based on the assumptions of fertility and mortality rates derived from historical trend and forecast for the United States.

Age-specific fertility rates are projected based on Oregon's past trends and past and projected national trends. Oregon's total fertility rate is assumed to remain below 2.0 children per woman during the forecast period, tracking at slightly lower than the national rate.

Life Table survival rates are developed for the year 2000. Male and female life expectancies for the 2000-2015 period are projected based on the past three decades of trends and national projected life expectancies. Gradual improvements in life expectancies are expected over the forecast period. At the same time, the difference between the male and female life expectancies will continue to shrink. The male life expectancy of 75.7 and the female life expectancy of 80.3 in 2000 are projected to improve to 78.8 years for males and 83.0 years for females by the year 2015.

Estimates and forecasts of the number of net migrations are based on the residuals from the difference between population change and natural increase (births minus deaths) in a given forecast period. The annual net migration between 2008 and 2015 is expected to remain in the range of 24,700 to 31,500, averaging 29,700 persons annually. The slowdown in Oregon's economy during the early years of this decade resulted in smaller net migration and slow population growth. Population growth and net migration rates in 2000 through 2004 were the lowest in over a decade. The current slowdown in Oregon's economy is expected to result in lower net migration and slowing population growth in the short-term with implications for the long-term forecast horizon.

**Table C. 1**

STATE OF OREGON  
POPULATION FORECASTS  
COMPONENTS OF CHANGE 1980 -2015

Year (July 1)	Population	Population Change		Births		Deaths		Natural Increase	Net Migration
